

Introduction

Oh hey, it's another one of these independent studies. Me and a friend are going to be going through William Fulton's *Algebraic Curves*. It will be hard, it will be long, and it might not work out for me, but who cares.

Algebraic Preliminaries

We will assume all rings are commutative with unity, where \mathbb{Z} is the integers, \mathbb{Q} is the rationals, \mathbb{R} is the reals, and \mathbb{C} is the complex numbers.

Any integral domain R has a quotient field K , which contains R as a subring, and any element in K may be written as a not necessarily unique ratio of two elements of R . Any one-to-one ring homomorphism from R to a field L extends uniquely to a ring homomorphism from K to L .

If R is a ring, then $R[x]$ is the ring of polynomials with coefficients in R . The degree of a nonzero polynomial $\sum a_i x^i$ is the largest integer d such that $a_d \neq 0$. The polynomial is monic if $a_d = 1$.

The ring of polynomials in n variables over R is $R[x_1, \dots, x_n]$. We write $R[x, y]$ and $R[x, y, z]$ if $n = 2$ and 3 respectively. Monomials in $R[x_1, \dots, x_n]$ are of the form $x^{(i)} := x_1^{i_1} x_2^{i_2} \cdots x_n^{i_n}$, where i_j are nonnegative integers, and the degree of the monomial is $i_1 + \cdots + i_n$. Every $F \in R[x_1, \dots, x_n]$ has a unique expression $F = \sum a_{(i)} x^{(i)}$, where $x^{(i)}$ are monomials, and $a_{(i)} \in R$. We say F is homogeneous of degree d if all $a_{(i)}$ are zero except for monomials of degree d . The polynomial F is written as $F = F_0 + F_1 + \cdots + F_d$, where F_i is a form of degree i , and $d = \deg(F)$ for $F_d \neq 0$.

The ring R is a subring of $R[x_1, \dots, x_n]$, and the ring $R[x_1, \dots, x_n]$ is characterized by the following: if $\varphi: R \rightarrow S$ is a ring homomorphism, and s_1, \dots, s_n are elements in S , then there is a unique extension of φ to a ring homomorphism $\bar{\varphi}: R[x_1, \dots, x_n] \rightarrow S$ such that $\bar{\varphi}(x_i) = s_i$. The image of F under $\bar{\varphi}$ is written $F(s_1, \dots, s_n)$. The ring $R[x_1, \dots, x_n]$ is canonically isomorphic to $R[x_1, \dots, x_{n-1}][x_n]$.

An element $a \in R$ is called irreducible if it is not a unit or zero, and any factorization $a = bc$ with $b, c \in R$ is such that either b or c is a unit. A domain R is a unique factorization domain (UFD) if every nonzero element in R can be factored uniquely up to units and ordering.

If R is a UFD with quotient field K , then any irreducible element $F \in R[x]$ remains irreducible when considered in $K[x]$.

Theorem (Gauss's Lemma for \mathbb{Z}): If $F \in \mathbb{Z}[x]$ is a monic polynomial that is irreducible, then F is irreducible in $\mathbb{Q}[x]$.

If F and G are polynomials in $R[x]$ with no common factors in $R[x]$, then they have no common factors in $K[x]$.

If R is a UFD, then $R[x]$ is also a UFD, and consequently $k[x_1, \dots, x_n]$ is a UFD for any field k . The quotient field of $k[x_1, \dots, x_n]$ is written $k(x_1, \dots, x_n)$ is called the field of rational functions in n variables over k .

If $\varphi: R \rightarrow S$ is a ring homomorphism, $\ker(\varphi) := \varphi^{-1}(0)$. The kernel is an ideal in R . An ideal in R is proper if $I \neq R$, and a proper ideal is known as maximal if it is not contained in any larger proper ideal.^I An ideal \mathfrak{p} is prime if, whenever $ab \in \mathfrak{p}$, then $a \in \mathfrak{p}$ or $b \in \mathfrak{p}$.^{II}

Let k be a field and I a proper ideal in $k[x_1, \dots, x_n]$. The canonical homomorphism π from $k[x_1, \dots, x_n]$ to $k[x_1, \dots, x_n]/I$ restricts to a ring homomorphism from k to $k[x_1, \dots, x_n]/I$. We regard k as a subring of $k[x_1, \dots, x_n]/I$, which is a vector space over k .

If R is an integral domain, then $\text{char}(R)$, the characteristic of R , is the smallest integer p such that $\underbrace{1 + 1 + \dots + 1}_{p \text{ times}} = 0$. If p exists, we say $\text{char}(R) = p$, else 0.

Note that if $\varphi: \mathbb{Z} \rightarrow R$ is the unique ring homomorphism from \mathbb{Z} to R ,^{III} then $\ker(\varphi) = \langle p \rangle$, so $\text{char}(R)$ is prime or 0.

If R is a ring, and $F \in R[x]$, and α is a root of F , then $F = (x - \alpha)G$ for some unique polynomial $G \in R[x]$. A field k is algebraically closed if any nonconstant $F \in k[x]$ has a root.

Exercise (Exercise 1.1): Let R be an integral domain.

- (a) If F and G are forms of degree r and s respectively in $R[x_1, \dots, x_n]$, show that FG is a form of degree $r + s$.
- (b) Show that any factor of a form in $R[x_1, \dots, x_n]$ is also a form.

Exercise: Let R be a UFD and K the quotient field of R . Show that every element $z \in K$ may be written as $z = a/b$, where $a, b \in R$ have no common factors. This representative is unique up to units of R .

Exercise: Let R be a principal ideal domain, and let P be a nonzero proper prime ideal in R .

- (a) Show that P is generated by an irreducible element.
- (b) Show that P is maximal.

^IAlternatively, an ideal I is maximal if the quotient ring R/I is a field.

^{II}Alternatively, an ideal \mathfrak{p} is prime if R/\mathfrak{p} is an integral domain.

^{III}This is because \mathbb{Z} is initial in the category of rings. See Aluffi.
