Problem 1

Let $X = \{0, 1\}^n$. Show that the Hamming distance:

$$d_H: X \times X \to [0, \infty)$$

$$d_H\left((x_j)_{j=1}^n, (y_j)_{j=1}^n\right) = \left|\left\{j \mid x_j \neq y_j\right\}\right|$$

defines a metric on X.

Proof:

• Symmetry:

$$d_{H}\left((x_{j})_{j=1}^{n}, (y_{j})_{j=1}^{n}\right) = \left|\left\{j \mid x_{j} \neq y_{j}\right\}\right|$$

$$= \left|\left\{j \mid y_{j} \neq x_{j}\right\}\right|$$

$$= d_{H}\left((y_{j})_{j=1}^{n}, (x_{j})_{j=1}^{n}\right)$$

- Definiteness: it is only the case that $d_H(x_j, y_j) = 0$ if $x_j = y_j$ for all j, by the definition of the distance.
- Similarly, since $x_i = x_i$ for all j, $d_H(x_i, x_i) = 0$.
- Let $(x_j)_j$, $(y_j)_j$, and $(z_j)_j$ be sequences of bits. The set $\{j \mid x_j \neq z_j\}$ is formed by taking all the values $\{j \mid x_j \neq y_j\}$ along with $\{j \mid y_j \neq z_j\}$, net of particular indices where $x_j = z_j$, but $x_j \neq y_j$. Therefore,

$$d(x,z) \le d(x,y) + d(y,z).$$

Problem 2

If $\|\cdot\|$ are equivalent norms on a vector space V, show that the induced metrics d and d' are equivalent.

Proof: Let $\|\cdot\|$ and $\|\cdot\|'$ be equivalent norms. Then, $\exists c_1, c_2 \in \mathbb{R}$ such that $\|v - w\|' \le c_1 \|v - w\|$ and $\|v - w\| \le c_2 \|v - w\|'$. However, this is the exact same statement as $d(v, w) \le c_1 d'(v, w)$ and $d'(v, w) \le c_2 d'(v, w)$. Thus, d and d' are equivalent metrics.

Problem 3

Let $\{X_k, d_k\}$ be a sequence of metric spaces with uniformly bounded metrics. Let

$$X:=\prod_{k\geq 1}X_k$$

denote the product.

(a) Show that

$$D: X \times X \to [0, \infty)$$
$$D(x, y) := \sum_{k \ge 1} 2^{-k} d_k(x_k, y_k)$$

defines a metric on X.

(b) Consider the case where $\{X_k\} = \{0,2\}$ and $d_k(a,b) = |a-b|$ for every $k \ge 1$. We get the abstract Cantor set

$$\Delta := \prod_{k \ge 1} \{0, 2\}$$

$$\Delta := \prod_{k \ge 1} \{0, 2\};$$

$$D(x, y) := \sum_{k=1}^{\infty} 3^{-k} |x_k - y_k|.$$

Prove that D(x, z) = D(y, z) implies x = y.

Problem 4

Let $(V, \|\cdot\|)$ be a normed space, and suppose $E \subseteq V$. Show that the following are equivalent:

- (1) E is bounded diam $(E) < \infty$;
- (2) $\sup_{v \in E} ||v|| < \infty$;
- (3) there is an r > 0 such that $E \subseteq B(0, r)$.

Proof: We will start by showing (i) implies (ii). Let E be a bounded subset of V. Thus, for all $v, w \in E$, $||v - w|| \le c$ for some $c \in \mathbb{R}^+$.

Problem 5

Let (X, d) be a metric space and suppose $A \subseteq X$. Show:

- (i) $\overline{A^c} = (A^\circ)^c$
- (ii) $(\overline{A})^c = (A^c)^\circ$

Proof:

(i) Let $x \in \overline{A^c}$. Then, $\exists \delta > 0$ such that $U(x, \delta) \cap A^c \neq \emptyset$. Therefore, $\exists \delta > 0$ such that $U(x, \delta) \cap A^c \neq \emptyset$.

Problem 9

Show that c_0 with $\|\cdot\|_{\mathcal{U}}$ is separable.

Proof: Let $z \in c_0$. Set $\varepsilon_1 > 0$, then finding N_1 large such that for all $n > N_1$, $z_n < \varepsilon_1$. Set $z' \in c_{00}$ to be equal to z on $1, \ldots, N_1$ and equal to 0 for all $n > N_1$.

Recall that for

$$E_n = \left\{ \sum_{k=1}^n \alpha_k e_k \mid \alpha_k \in \mathbb{Q} \right\},$$

$$E = \bigcup E_n,$$

E is dense in c_{00} , meaning that there exists some $w \in c_{00}$ such that $\|z' - w\| < \varepsilon$ for any $\varepsilon > 0$. However, since z' = z for all n from $1, \ldots, N_1$, and the index of $\|z\|_u$ is contained in $1, \ldots, N_1$, this means $\|z - w\| < \varepsilon$, meaning E is dense in c_0 .

Since E is countable, this means c_0 is countable.

Problem 10

Let ${\mathcal C}$ denote the Cantor set. Show that ${\mathcal C}$ is nowhere dense.

Proof: We know that C is closed, meaning all we need show is that $C^0 = \emptyset$.

Suppose toward contradiction that \mathcal{C}^0 is not empty. Then, $\exists x \in \mathcal{C}$ and $\varepsilon > 0$ such that $(x - \varepsilon, x + \varepsilon) \subseteq \mathcal{C}$.

Find m so large such that $3^{-m} < \varepsilon$. Then, $(x - \varepsilon, x + \varepsilon)$ must be contained in a subinterval with length $\frac{1}{3^m}$. However, $2\varepsilon > \frac{1}{3^m}$, and every subinterval in the element \mathcal{C}_m has length $\frac{1}{3^m}$.
